Quickly porting legacy Fiddler extensions to Clearinet

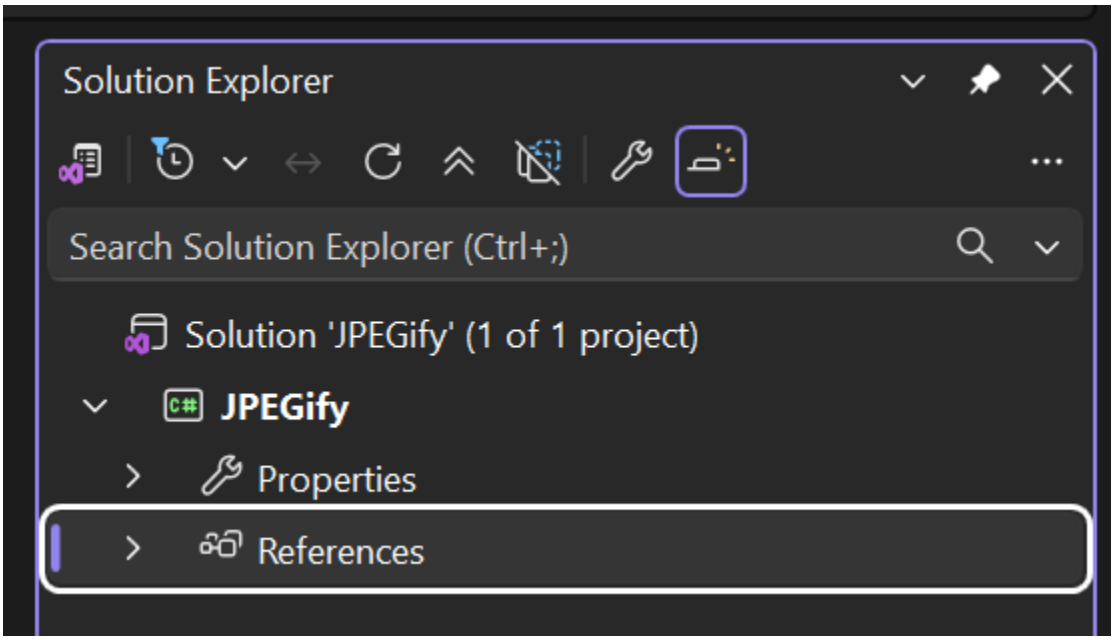

1. Save https://gist.github.com/ericlaw1979/412648cd7bfe887920dd5479f952080a to c:\src\
2. Use GitHub Desktop to clone the Clearinet project to C:\src\cin
3. Launch Visual Studio and choose “Class Library **(.NET Framework)**”

Name your project **JPEGify**, and put it in a new subfolder of c:\src:

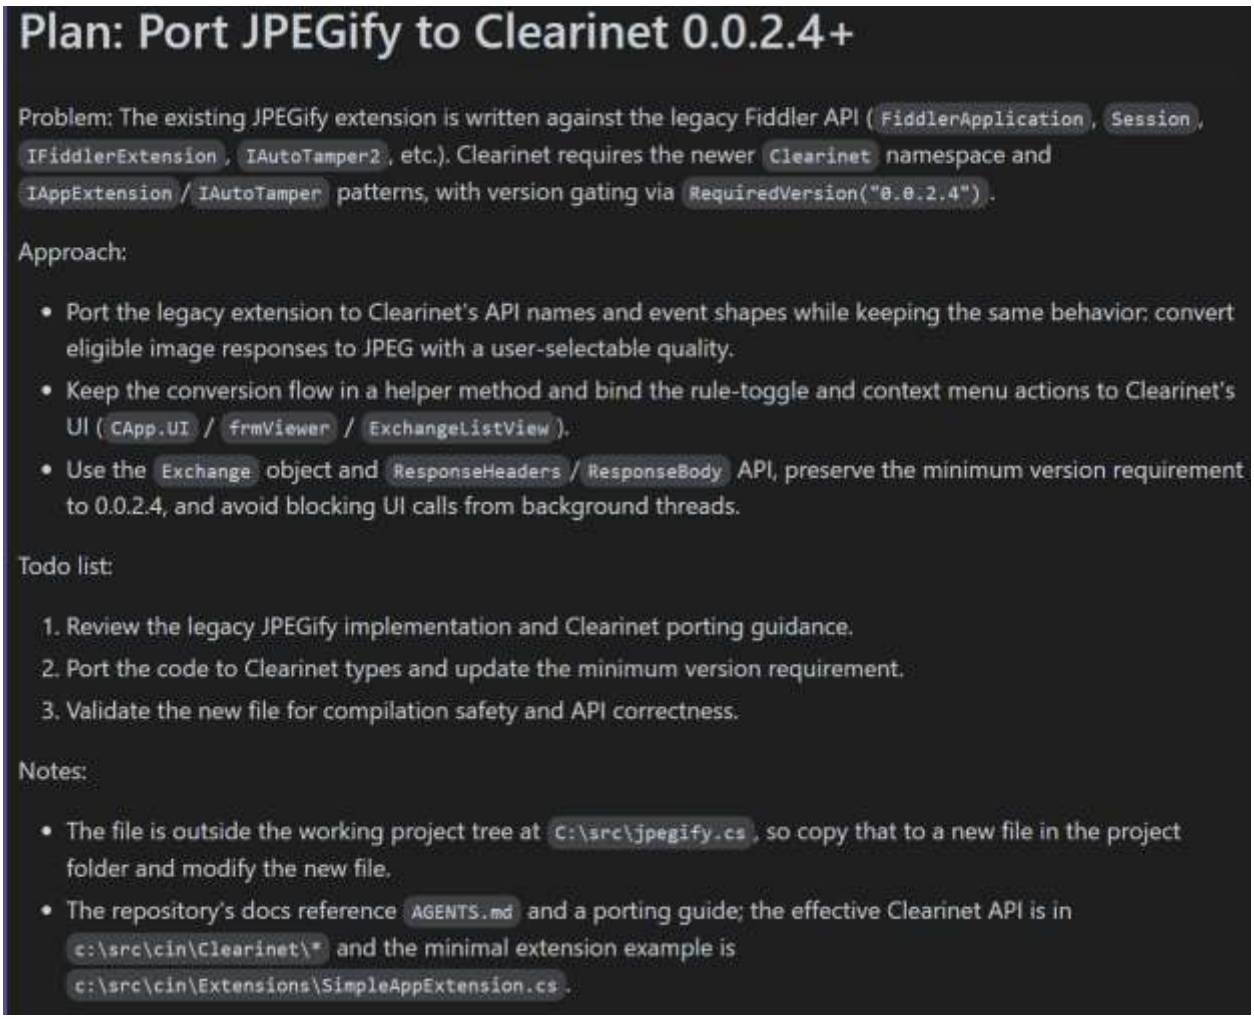

Delete the default `class1.cs` file so the project is empty.

In the Github Copilot Chat tab, type:

> `We are building an extension for Clearinet. Following the guidance in C:\src\cin\docs\AGENTS.md and C:\src\cin\docs\EXTENSIONS.md, create a new version of c:\src\jpegify.cs that targets Clearinet version 0.0.2.4 and later. Rather than editing the original jpegify.cs file, create a new copy in this project's folder.`

Approve the various permission prompts, assuming they all seem reasonable.

Plan: Port JPEGify to Clearinet 0.0.2.4+

Problem: The existing JPEGify extension is written against the legacy Fiddler API (`FiddlerApplication`, `Session`, `IFiddlerExtension`, `IAutoTamper2`, etc.). Clearinet requires the newer `Clearinet` namespace and `IAppExtension` / `IAutoTamper` patterns, with version gating via `RequiredVersion("0.0.2.4")`.

Approach:

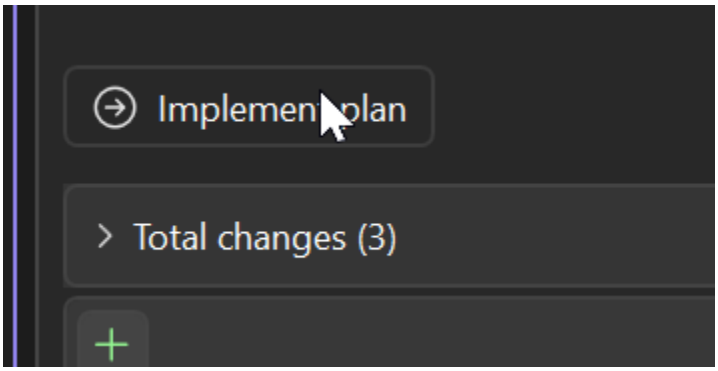

- Port the legacy extension to Clearinet's API names and event shapes while keeping the same behavior: convert eligible image responses to JPEG with a user-selectable quality.
- Keep the conversion flow in a helper method and bind the rule-toggle and context menu actions to Clearinet's UI (`CApp.UI` / `frmViewer` / `ExchangeListView`).
- Use the `Exchange` object and `ResponseHeaders` / `ResponseBody` API, preserve the minimum version requirement to 0.0.2.4, and avoid blocking UI calls from background threads.

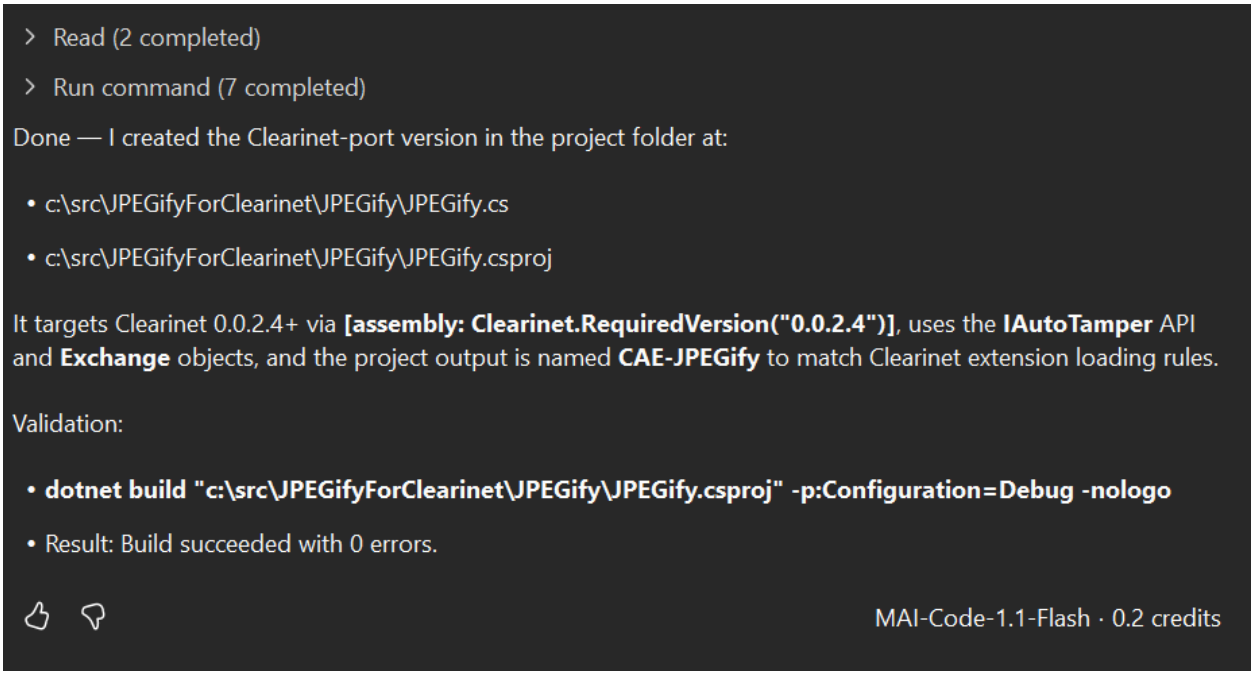

Todo list:

1. Review the legacy JPEGify implementation and Clearinet porting guidance.
2. Port the code to Clearinet types and update the minimum version requirement.
3. Validate the new file for compilation safety and API correctness.

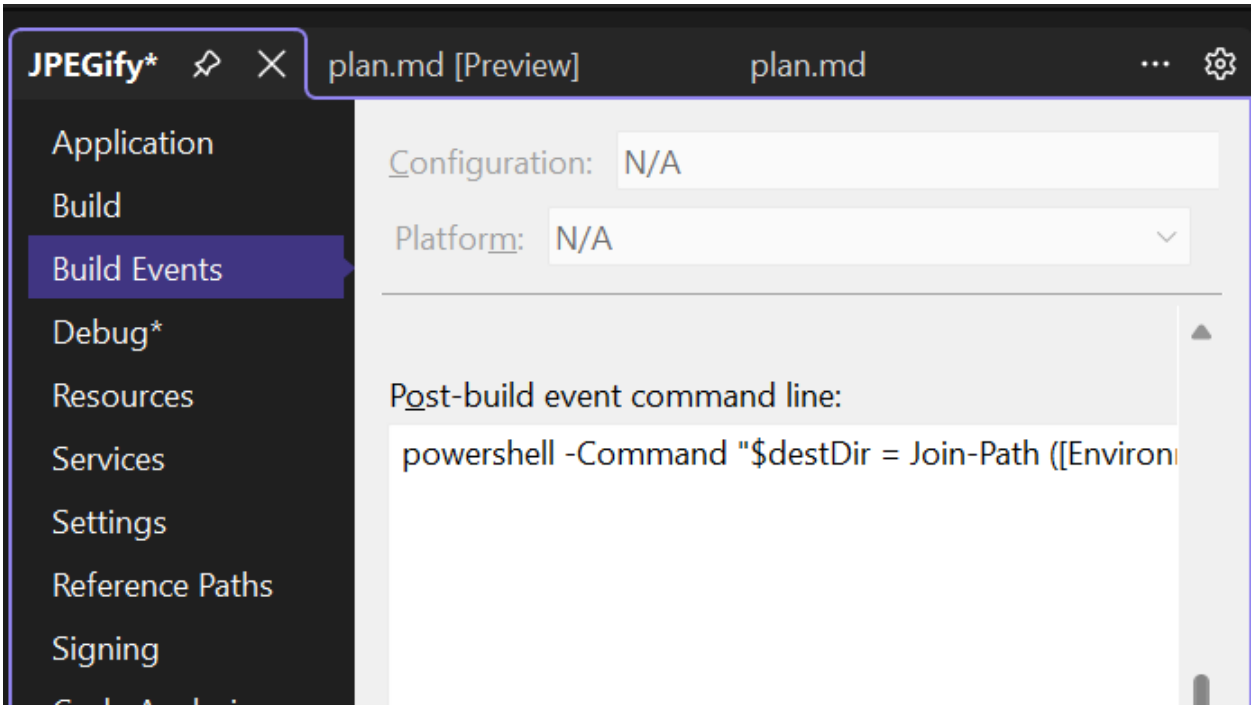

Notes:

- The file is outside the working project tree at `C:\src\jpegify.cs`, so copy that to a new file in the project folder and modify the new file.
- The repository's docs reference `AGENTS.md` and a porting guide; the effective Clearinet API is in `c:\src\cin\Clearinet\*` and the minimal extension example is `c:\src\cin\Extensions\SimpleAppExtension.cs`.

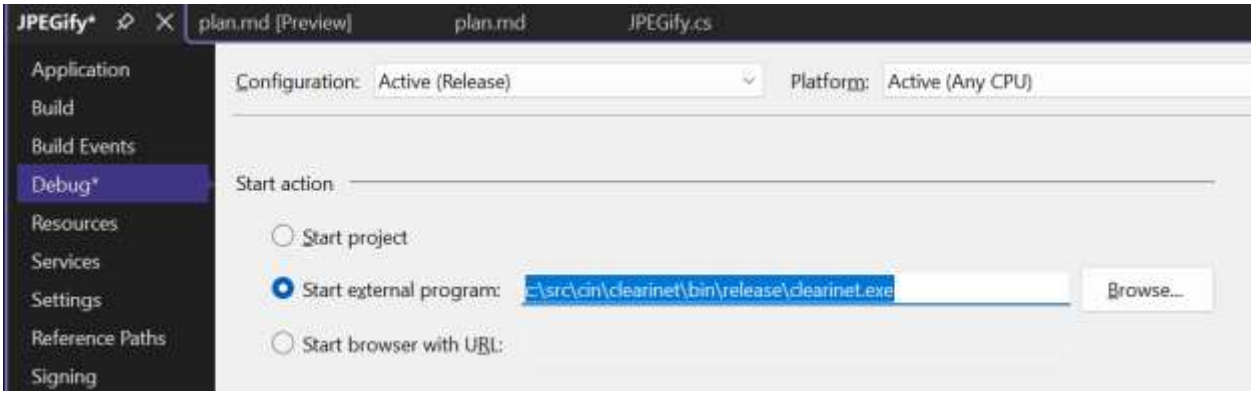

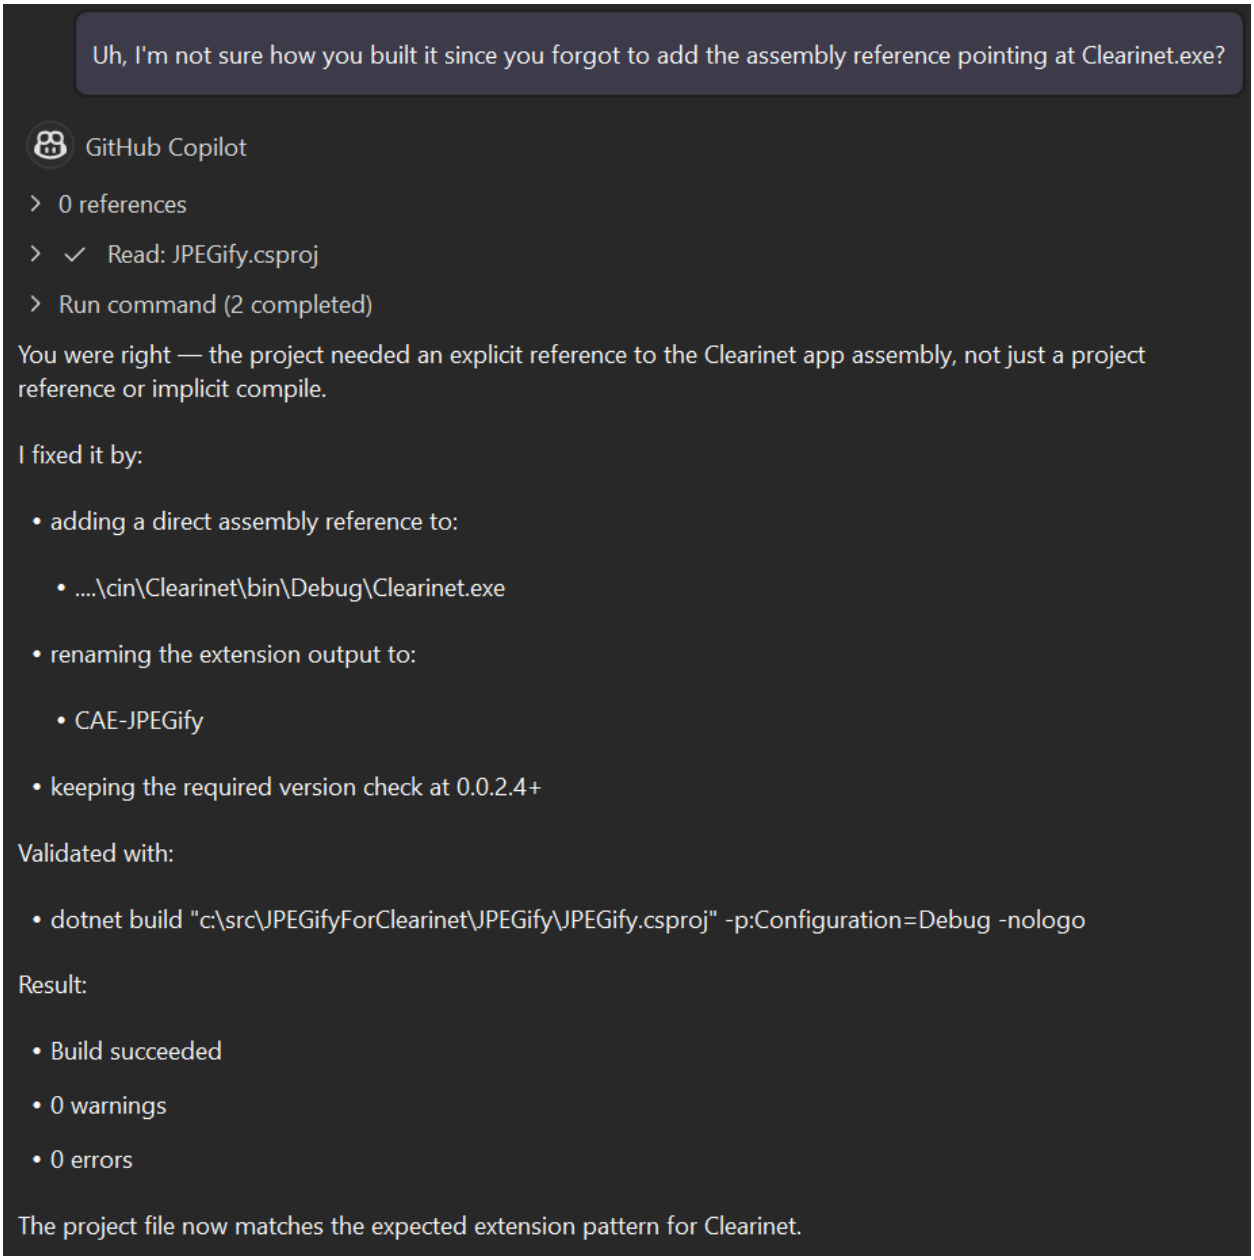

```
powershell -Command "$destDir = Join-Path
([Environment]::GetFolderPath([System.Environment+SpecialFolder]::MyDo
cuments)) 'Clearinet\Extensions'; if (!(Test-Path $destDir)) { New-
Item -ItemType Directory -Path $destDir -Force }; Copy-Item -Path
'$(TargetPath)' -Destination $destDir -Force"
```

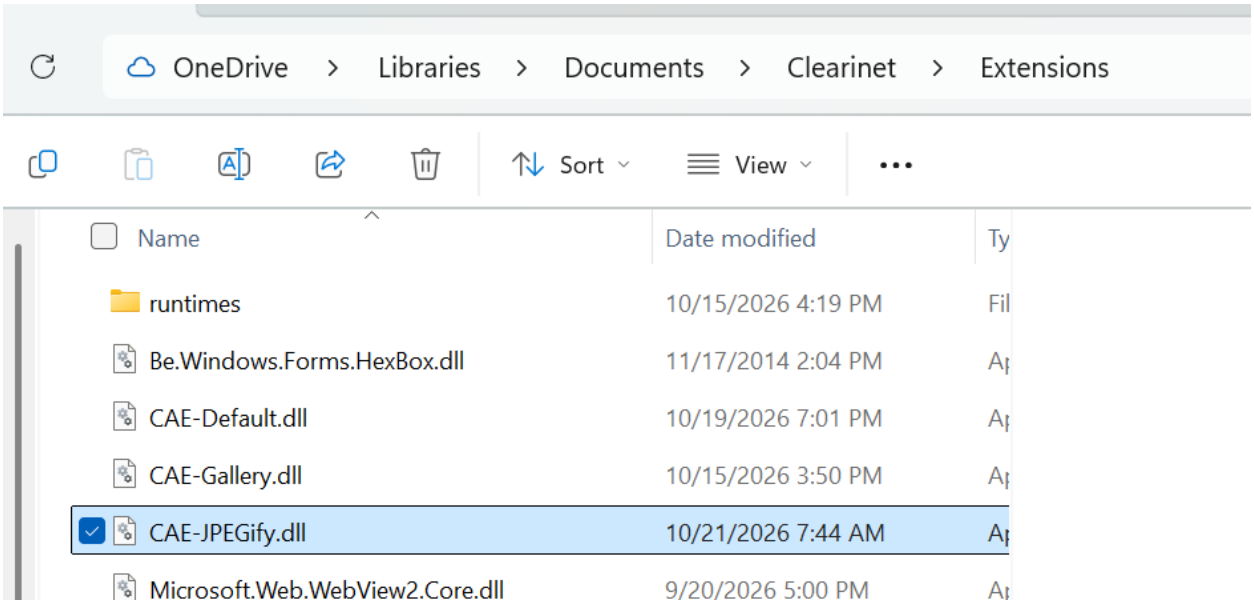

```
c:\src\cin\clearinet\bin\release\clearinet.exe
```

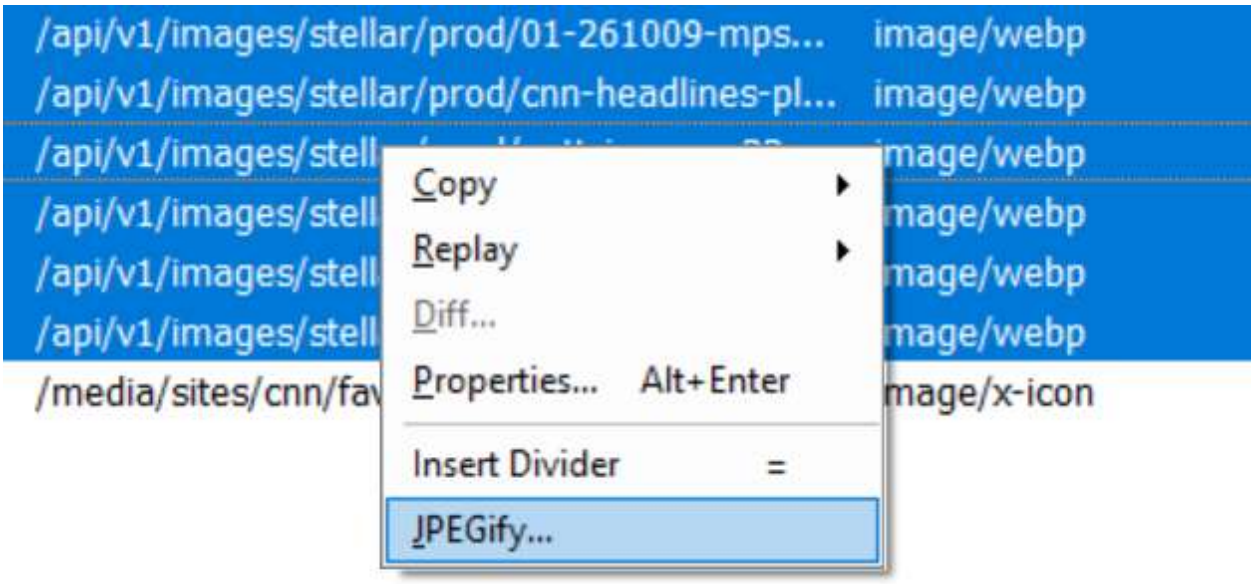

Copy `CAE-JPEGify.dll` to your %Documents%\Clearinet\Extensions folder:

Then restart Clearinet. On the **Extensions** page in Tools > Clearinet Options, you'll see your new Assembly:

Now, use the command:

/api/v1/images/stellar/prod/01-261009-mps... image/webp
/api/v1/images/stellar/prod/cnn-headlines-pl... image/webp
/api/v1/images/stell image/webp
/api/v1/images/stell mage/webp
/api/v1/images/stell mage/webp
/api/v1/images/stell mage/webp
/media/sites/cnn/fav mage/x-icon
